

ENGINEERING CENTER

Final Editorial Layout + Content + SEO Blueprint

A technical storytelling hub that explains how an AAC plant works, how the production process flows and how the plant layout connects machinery into one complete system.

Understand the system. Then understand the machine.

AAC production process | Plant layout | Equipment context | Engineering visualization

Design intent

The Engineering Center should feel like an engineering publication, not a technical documentation portal.

01

ONE BIG IDEA

Lead each section with one strong statement and one clear visual.

02

PLANT AS STORY

Use the complete plant and process to explain why each stage exists.

03

MINIMAL UI

Thin lines, precise labels, large type. No dense card grids.

The two approved content pillars are **AAC Production Process** and **AAC Plant Layout**. Keep the center page concise, then let the layout page carry the deeper interactive exploration.

Source: the original Laxmi catalogue includes AAC process material and general-arrangement plant layouts for AAC and block/panel systems.

Engineering begins with understanding the system

The hero should introduce the center as the place to understand process + plant, not as another sales page.

AAC ENGINEERING CENTER

Understand the system behind the plant.

Follow the AAC production process, explore the plant layout and see how equipment fits together across the line.

Hero visual: clean plant diagram or real plant image with faint engineering annotations. Avoid a busy machinery collage.

Primary CTA: **Explore Production Process** → Secondary: **View Plant Layout** →

AAC Production Process

Make this the main editorial story on the Engineering Center landing page.

Short intro: **See how raw materials move through preparation, batching, pouring, precuring, cutting, autoclaving and packing to become finished AAC products.**

Recommended interaction: click/scroll through each stage. Show one real/approved visual and one concise explanation at a time.

01

PROCESS STEP

01 - 08 stage navigation.

02

MACHINE LINK

Match each stage to relevant equipment.

03

LAYOUT LINK

Show where the stage sits in the plant.

AAC Plant Layout

This is the technical centerpiece and should feel like an interactive engineering drawing.

Use the original Laxmi GA layout as the engineering source. Present it with a clean web layer: zoom, pan, stage highlights and concise labels.

CTA: Open Full Plant Layout →

Explore the plant

Do not make users hunt through a technical drawing. Reveal information progressively.

01

ZOOM

Smooth mouse wheel / pinch zoom with an obvious reset control.

02

HOTSPOTS

Click a plant zone to reveal stage, equipment and role.

03

MINI MAP

Show current viewport so users never lose orientation.

When a hotspot is selected, display a small editorial panel with: **Stage** → **What happens** → **Related equipment** → **Link to machinery**.

Keep the panel outside the drawing where possible. Avoid popover clutter over the plant.

ACTIVE ZONE: CUTTING

Green cake is cut to required dimensions before autoclaving. Related equipment: cutting systems.

[VIEW EQUIPMENT →](#)

Process + equipment + layout

This section connects the Engineering Center to the Machinery & Equipment page and keeps the site internally coherent.

Use a simple formula:

$$\text{PROCESS} + \text{MACHINE} + \text{LOCATION} = \text{SYSTEM}$$

Every process stage should offer a clear next link to the relevant machinery group. Every machinery group can point back to the process and plant layout.

This avoids isolated pages and creates a clear content graph for both users and search engines.

Engineering proof without marketing noise

Use diagrams, plant layouts, workshop visuals and real project images as evidence.

01

PLANT VISUALS

GA layouts and approved 3D/plant views.

02

PROCESS VISUALS

Production stages and equipment relationships.

03

FACILITY VISUALS

Workshop/manufacturing context.

04

PROJECT VISUALS

Installed plants and expansion work.

The original Laxmi catalog contains facility, workshop, dispatched equipment, installation and expansion sections; cross-link these proof assets instead of creating repetitive testimonial blocks.

Engineering Center SEO specification

Target technical information searches while keeping the page readable for investors and plant buyers.

AAC Engineering Center | Production Process & Plant Layout | Laxmi En-Fab

Title

Explore the AAC production process and plant layout, and understand how machinery fits together in an AAC production system.

Meta

AAC Engineering Center

H1

AAC production process; AAC plant layout; AAC plant engineering; AAC manufacturing process.

Core terms

AAC production line; AAC plant machinery; AAC cutting process; AAC autoclave process.

Support terms

Solutions; Machinery & Equipment; Projects; Why Laxmi; Plant Layout; Contact.

Internal links

SEO note: keep the landing page broad; put detailed process/location content on the Plant Layout page and the five Academy pages.

Responsive + implementation

The Engineering Center must stay readable even when the plant diagram becomes complex.

01

DESKTOP

Large diagram, horizontal process rail, editorial headings.

02

TABLET

Scaled diagram + scrollable stage rail + compact info panel.

03

MOBILE

Vertical process flow, simplified plant view, tap hotspots.

Implementation: use semantic HTML, CSS variables, SVG where appropriate, IntersectionObserver for reveal, lightweight JS, optimized images and a reduced-motion fallback.

Avoid loading multiple giant plant images at once. Prefer one optimized master layout plus lightweight overlays or SVG labels.

Final

Understand your plant before you build it.

CTA: Explore the production process, plant layout and machinery context.
